

1. Import **airplane.sql** from **Database** folder to phpmyadmin(this sql file contains all the tables need for the application)
2. the sql driver(**mysql-connector-java-5.1.34-bin.jar**) is located in **lib** folder, and you should add it to your reference libraries. here is how you will do in Eclipse, right click the package,

find the **Configure Build Path**, then you will open the window below, and then drag the **mysql-connector-java-5.1.34-bin.jar** file from the **lib** folder to the library session

3. In order to make the program find the correct media(images, backgrounds, icons,etc), you need to link to the correct folder. in the **Manipulate_db.java**, there is a private field named **folderPrefix**, which is to specify the folder prefix for the media. You need to change it into your exact folder address for the **media** folder
